Preface

Food Security and nutrition was 2013's Portuguese Speaking Countries Presidency Theme. As the only small island state member of CPLP located in Southeast Asia and in the Coral Triangle, fisheries play crucial role in Timor-Leste food security and nutrition. This document goes some way to showing the Government's dedication to honour its commitments to international environmental conventions as well to demonstrate Timor-Leste's dedication to integrate in the wider community of nations which is ASEAN, by taking the first steps in managing our common resource, the ocean that unites us all.

The Office of the Secretary of State for Fisheries and Aquaculture was happy to lead the development of the country's first Aquaculture Development Strategy which provides a clear vision of how the aquaculture sector can contribute for strengthening household food security levels and improve nutrition of communities living in Timor-Leste's highlands which have limited access to the ocean.

Now, it is time to turn attention to the policy and strategy frameworks for development of the marine fisheries sector. This simple report provides the preliminary notes to guide coming discussions about investments in managing Timor-Leste's coastal and marine resources. In particular, it identifies key sites that are important for fisheries productivity, which the government recognises as priority sites to be pursued for improved management.

We were pleased to work with Conservation International in the preparation of this report and hope that it marks the first step in a journey towards the development of a Policy and Strategy for Sustainable Development of the Marine Fisheries Sector in Timor-Leste. Such documents would provide cornerstones for the sector's contribution to Timor-Leste's economic growth and food security into the future.

Honourable Rafael Pereira Gonçalves
Secretary of State for Fisheries and Aquaculture

A Glance at the Report

This report focused at prioritizing fisheries management areas in coastal and marine areas with depths between 0-40 meters depth, along the North Coast of Timor-Leste. New data has shown that there are additional sites that ought to be considered into the current Lesser Sunda MPA design. These new sites (Buruma ($\approx 5.6 \text{ km}^2$) and entire reefs surrounding Atauro ($\approx 98 \text{ km}^2$)) would greatly improve the Lesser Sunda design for Timor-Leste.

New data has also shown that Government could start management efforts in smaller areas than those proposed in the Lesser Sunda MPA design. Government could prioritize investment of management activities in smaller management areas in Metinaro ($\approx 10.9 \text{ km}^2$), Behau ($\approx 33 \text{ km}^2$), Beacou ($\approx 9.2 \text{ km}^2$), Loikere ($\approx 2.6 \text{ km}^2$).

NDFA could use the prioritized areas in this report to guide coming discussions with partners and ensure the efficiency of investments in areas described in the Lesser Sunda MPA design, as well as to honour the country's commitments to International Treaties.

Summary of Key findings

1. The preliminary analysis for the Lesser Sunda MPA design, conducted by Wilson et al. (2009) has certain gaps; there are habitats and ecological features that did not show up as important in the initial review due to the paucity of data available at the time. Further to this, several of the sites proposed in the Lesser Sunda MPA Design despite being ecologically important have experienced considerable damage since the initial design was produced.

Results from other mapping exercises such as Bogg et al (2009), survey data from Erdman and Mohan (2012) and data collected by NOAA in 2013 are now being used by DNPA to cross check former MPA site selection. This new information has shown that several other sites which are important from a fisheries sustainability perspective have not been captured by the Wilson et al. (2009) design.

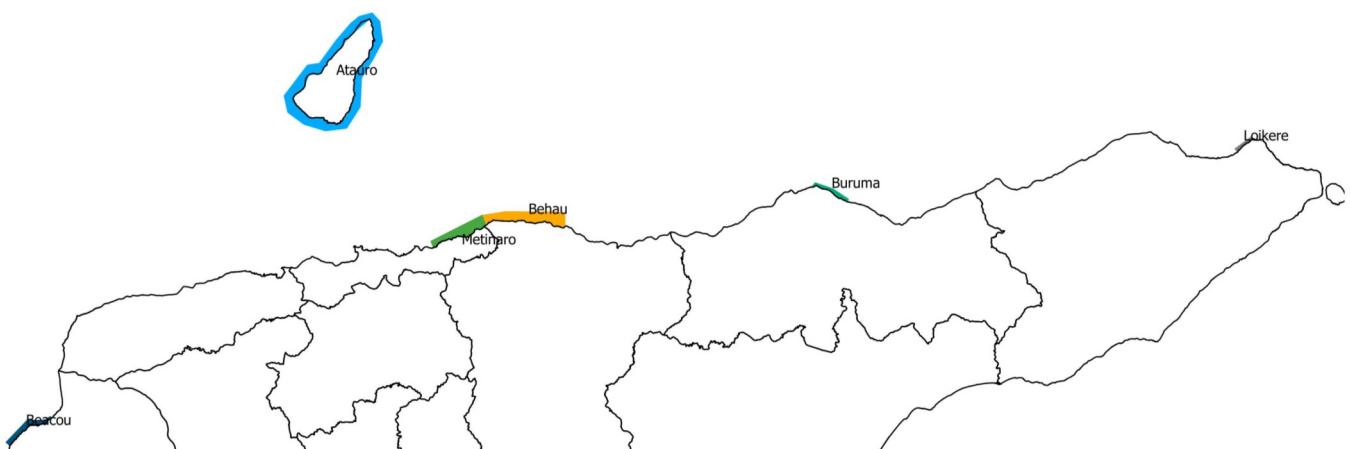

2. There are a number of key sites which are significantly smaller than those in the Lesser Sunda design, but which would be useful to focus management towards in order to achieve maximum fisheries replenishment benefits in the short-medium term.

Experience from previous attempts led by DNPA to manage marine and coastal areas in Timor-Leste have shown that sustainable financing of the large-scale marine and coastal areas proposed by Wilson et al. (2009) are almost impossible at this point of time. This is due to the many competing national priorities and limited State budget allocation for the Fisheries sector, combined with the trend for most bilateral and multilateral partners to provide financial support for projects of limited length.

These experiences—along with the latest data available—have been taken into account during the process of prioritizing smaller, more manageable areas within the formerly proposed larger

areas. The proposed smaller areas would still afford protection to the key ecological features and functions required for fisheries replenishment. Smaller areas could be achieved in a relatively short period of time, with future expansions of the protected areas able to be pursued as the NDFA becomes better equipped to do so.

Five priority areas for fisheries replenishment have been identified — Atauru, Batugade, Behau, Metinaro, Buruma and Mehara.

Atauru

The entire marine habitat surrounding the island is of ecological importance and crucial to the livelihoods of its people. Despite so, only a part of the Island has been captured and set forward as a priority. Data from NOAA collected in 2013 has clearly shown correlations between fish biomass and population density in different parts of the island. Furthermore, fish biomass within the proposed protected areas was markedly lower than sites under no form of management but with lower population densities. Given these complexities, the entire Atauru Island should be considered a management priority zone. Efforts should be made to protect the habitats and stocks found in the West Coast of Atauru, and restocking areas which take into account the bathymetric uniqueness of this Island need to be considered.

Batugade

Berluli, the area in West Timor which borders Batugage, is an area of high biological importance due to mangrove and other associated habitats. The area past Berluli from the Timor-Leste border (Mota Ain) until the rock which gives the name “Batuk gede” (Big Rock) has virtually no coral reef based on NOAA survey data which struggled to find hard-substrate bottoms for Fish biomass surveys. There is a big continual area of reef within the greater unit which Wilson et al. (2009) called Batugade where coral reef health is good and fish stock and biomass appeared healthy. This area close to the Fishing Centre of Beacou ought to be considered a priority area for management interventions.

Importantly, population growth in the Bobonaro and Liquica districts has lead to an increase in the number of fishermen since 2005, and associated increases in fishing pressures. It is important that Government focuses some efforts in awareness raising to establishing a co-managed fisheries replenishment area (a no take area) in Beacou to ensure the sustainable growth of this fishing centre.

It is important to note that some level of finance has already been channelled to areas *nearby Beacou but not in Beacou*. Such efforts include those of the ADB through its GEF funded CT-Pacific program. Efforts should be made to ensure the alignment of that program with current findings.

Behau

Behau area is important from both an ecological and socio-economic perspective. Field survey data shows an area with high coral cover, important fish spawning habitats and a continuous sea-grass bed stretching from Suco Duyong to Suku Uma Kaduak. Despite this, Wilson et al. (2009) design does not include this area. This is an area under increasing threat from pressures associated with population growth and rural development and requires additional management interventions.

Conversely, the area immediately to the east of Behau (Lamsana) was included in the original Lesser Sunda design but the area of ecological importance has been found to be fairly small and localized. The area is also under considerable threat and has suffered impacts of sedimentation and bloom in Crown of Thorns which have damaged several reef patches (Erdman & Mohan, 2012). Subsequent surveys have shown similar results and the absence of coral reefs (NOAA & DNPA unpublished data, 2013).

The Lamsana area is currently under local management arrangements with the Suco Council. This process was lead by the District Fisheries Officer and established with support from the Locally Managed Marine Areas group in Indonesia, funded through the Coral Triangle Support Partnership (CTSP). It is important to strengthen the current management systems which have been put in place so as to deal with land based threats, particularly sedimentation, which has been identified as a significant threat around Ma'abat. Furthermore, more support should be provided to the district to start exploring the possible expansion of the management zone to include a replenishment zone in the area between Suco Duyong and Uma Kaduak (Behau).

Metinaro

Metinaro is covered by the proposed area that Wilson et al.(2009) somewhat confusingly called Behau (it doesn't include Behau at all). This area is biologically important due to the Mangrove, Seagrass bed and coral reef association which they host, an association hard to find in country as well as in the region. Notably, Timor-Leste's largest continuous mangrove forest and seagrass bed are found in the area of Metinaro. This an area under increasing threat from pressures associated with population growth and rural development and requires additional management interventions.

Buruma

Unfortunately former prioritization exercises failed to identify an area in Baucau. Despite this, new biological data points to the importance of an area called Buruma which has healthy fish stocks, good healthy habitats and a markedly high number of apex predators which are not found elsewhere in the island. For these reasons, Buruma should be considered as a priority area for the establishment of a fisheries replenishment area as well as the introduction of guidelines for sustainable artisanal fisheries. Additionally, further surveys ought to be conducted in this area to ascertain if the biological values justify the proposal of this area as a Marine Protected Area.

While this zone is still far away from the nearest managed area (Nino Konis Santana National Park) [about 80 km apart] having an area in Baucau may be seen as the Government taking one step towards connecting different fisheries management areas and increase connectivity between sites.

Mehara

In 2012, NDFA worked with the USAID Coral Triangle Support Partnership (CTSP) to conduct a Rapid Assessment Program in the Nino Konis Santana National Park. The surveys recommended the establishment of a “no take” area between Com and Tutuala to ensure biological connectivity between the sites and improved climate resilience for the system as a whole. The site of Loikere, in Suco Mehara, was identified with strong scientific evidence demonstrating its ecological importance and value. Loikere has high biodiversity and is thought to play an important role in the life cycle of several important species. Despite this, the site is under increasing threat from illegal fishing. Loikere is a priority area for the establishment of a “fisheries no take area”.

Importantly, the CTSP project also reviewed the design of the MPA system within the National Park and recommended the establishment of an additional protected site on the South Coast, near the Lore 1—Maupitine border. Again, the additional site was recommended to improve connectivity and climate resiliency. Insufficient data is available to identify a proposed site at this stage.

Prioritizasaun zona jestaun rikusoin peskeiru iha Timor-Leste nia Tasi Feto

Tan sá mak ita prioritiza zonas asaun?

Ita prioritiza zona asaun hodi asegura alokasaun efisienti ba rekursu limitadu ne'ebé Diresaun Nasional Pesca no Akikultura (DNPA) iha hodi hala'o jestaun ba rikusoin peskeiru Timor-Leste nia.

Maski Zona Hera iha Ai-parapa, maioria ai-parapa no du'ut tasi iha hetan iha zona Metinaro.

Datoluk, Ahu-ruin husi Behau la tama ba zona ne'ebé Wilson no kolega hanaran Behau. Importante realsa katak iha Metinaro ita hetan duni Ahu-ruin no faixa ne'e kontinua husi Suku Duyong to'o Suku Uma-kaduak (NOAA, DNPA unpublished).

Iha área jestaun ne'e, ne'ebé Wilson no kolega hanaran Behau, rekomendasaun mak fahe ba Zona tolu (3): Cristo Rei, Hera-Metinaro, Behau.

Haktuir análise ba dadu biolójiku, análise ba dadu sosio-ekonómiku, análise ba ameasa **zona ho prioridade a'as liu iha unidade ne'e mak zona (1) Metinaro no (2) Behau.**

Zona Atauru - Illa Ataúru tomak iha importânsia ekolójika makás. Maski parte balun deit husi Ataúru hetan proposta ba área protejida, tuir lolós dadu husi NOAA ne'ebé foti iha Juñu 2013 hatudu katak pontu vista biomasa ikan nian, zona ne'ebé la sai área protejida iha volume ikan makás liu duke ida ne'ebé atu sai zona protejida. Ne'e rezultadu husi atividade peska no densidade populasional besik área protejida. **Ataúru tomak zona prioritáriu ba jestaun prioridade jestaun no protesaun stock peskeiru iha kosta oeste, zona prioritáriu ba atividade atu ha-la'o restocking (zona repovoamentu peskeiru) kosta este.**

Zona Lamsanak – Tuir lolós zona Lamsanak, ho área luan lós maibé zona ho importânsia ekolójika makás mak zona ki'ik ai-parapa iha uma lisan Lamsana nian kraik, maski nune'e, zona ne'e hetan estragu makás husi impaktu sedimentasaun no mós atake biolójiku ne'ebé hamate ahu-ruin lubuk ida iha zona Lamsanak (Erdman & Mohan, 2013). Estudu tuir mai iha zona ne'e nia laran (NOAA & DNPA, unpublished) mós hatudu rezultadu ne'ebé hanesan.

Tuir lolós zona Lamsana hetan ona protesaun liu husi Regulamentu Suku, ne'ebé lidera husi servisu Distrital Peskas iha Distritu Manatuto ho tulun husi LMMA Indonesia iha programa Coral Triangle Support Partnership (CTSP) nia mahon.

Importante tebes atu hametin sistema jestaun rai maran iha zona adjacente ba zona Lamsana hodi hamenus impaktu sedimentasaun ba zona ahu-ruin ne'ebé importante ba produtividade peskeira no mós importante ba komunidade iha Suku oioin liu-liu suku Ma'abat.

Haktuir análise, rekomendasau mak atu kontinua nafatin suporta atividade peska distritu atu ha-la'o jestaun ba zona Lamsana (Tasi no rai maran) no mós fó tulun tan ba Distritu Manatuto atu jere di'ak liu tan unidade Behau.

Zona Buruma – Infelismente iha análise husi Wilson no kolega, área Baucau la dun hetan pontu ho importânsia ba konservasaun. Tuir dadu biolójiku ne'ebé foti iha fulan Jullu tinan 2013 ho tulun husi ekipa NOAA, ita hare'e katak zona Baucau, liu-liu iha Buruma iha habitat no biomasa kapás no mós ita hare'e katak iha número ikan predadór a'as kompara ho fatin seluk.

Maski zona ne'e ki'ik no ho distânsia liu 80 km husi Parke Nasionál Nino Konis Santana, nia bele fó tulun iha prosesu hamosu ligasaun (connectivity) entre zona protejidas no aban bainrua, tuir estudu científico kle'an liu bele sai posível área protejida.

Buruma zona prioritáriu iha prosesu estabelesimentu zona repovoamentu peskeiru no mós introdús regra peska ne'ebé sustentável.

Parke Nasionál Nino Konis Santana – Haktuir servisu husi DNPA hamutuk ho programa Coral Triangle Support Partnership (CTSP) no peskiza ne'ebé hato'o husi Erdman no Mohan (2012) ita tenke hamosu zona repovoamentu peskeiru ka "no take" area ida tan entre Tutuala no Com, ne'e halo katak design ne'e tuir prinsípiu daualuk husi matadalán rejionál.

Tuir dadu ekolójiku iha Loikere, Suku Mehara, zona ne'e iha indise biodiversidade a'as no fó

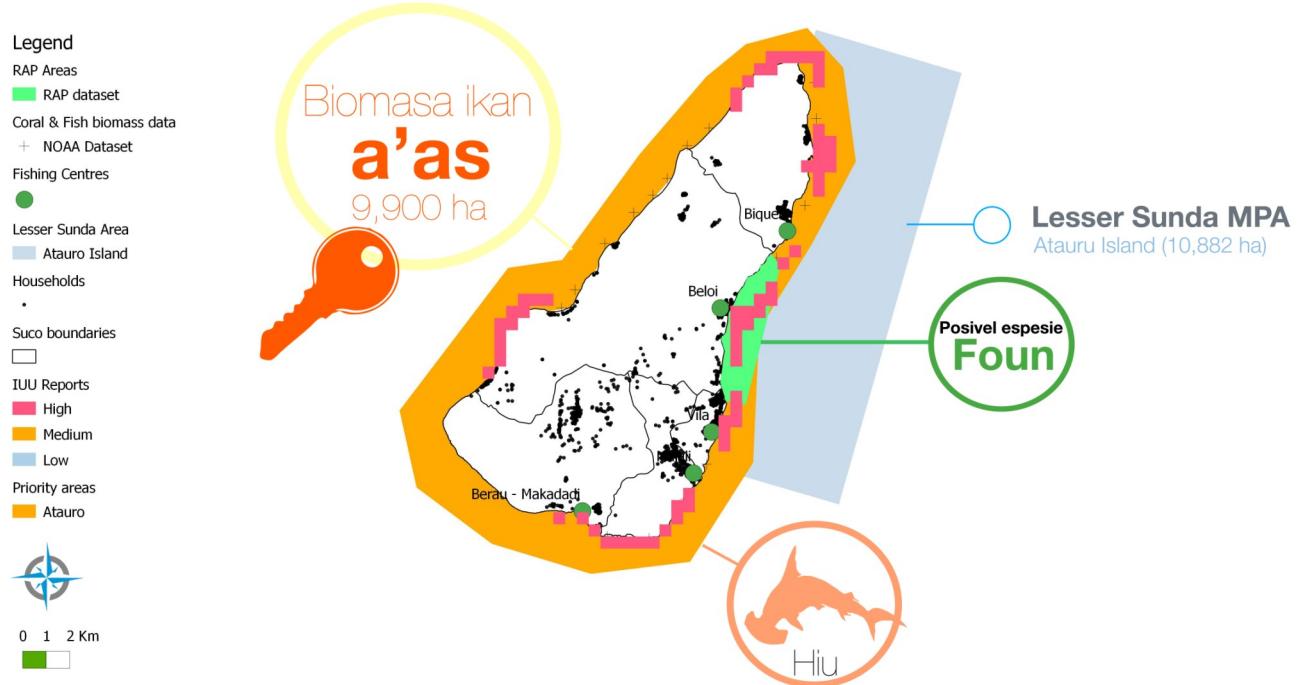

habitat di'ak ba espésie oioin nia siklu-moris. Ida ne'e hamutuk ho interese husi lideransa lokal Suku Mehara nian atu proteje fatin ne'e, no mós relatório atividade peska ilegal iha Loikere, zona ne'e sai pontu importante atu jere.

Loikere zona prioritáriu ne'ebé tenke halo zoneamento no estabelese zona repovoamentu peskeiru

Sumáriu

1. Ho dadu ne'ebé iha Timor-Leste bele hahú prioritiza zona jestau iha tasi badak (0-≈40 metru profundidade);
2. Dadu foun hatudu katak iha zona balun ne'ebé seidauk tama ba zona importante ba jestau tuir Lesser Sunda MPA Design
3. Dadu foun hatudu katak DNPA bele hahú konsidera nu'udar zona prioritáriu ba jestau: Buruma (≈5.6 km²), Ataúru tomak (≈98 km²);
4. Dadu foun hatudu mós hatudu katak esforsu jestau Lesser Sunda MPA bele hahú iha zona Metinaro (≈10.9 km²), Behau (≈33 km²), Beacou (≈9.2 km²), Loikere (≈2.6 km²);
5. Hodí facilita investimentu iha zona jestau tasi nian ne'ebé foin teme, DNPA bele uza zona hirak ne'e, hodí sai pontu partida atu facilita no asegura efesiénsia servisu DNPA nia iha Lesser Sunda MPA areas no konsentra esforsu atu kumpri responsabilidade naraun nian ba tratadu internasional ne'ebé Timor-Leste asina ona.
6. Tuir dezenvolvimentu kapasidade, ekipamentu no infra-estrutura, no peskiza DNPA bele haberlar zona prioritáriu hodí inklui área tomak iha Lesser Sunda MPA design ka altera design ne'e tuir estudo viabilidade no estudo biolójiku no sosio-ekonómiku atu asegura efesiénsia investimentu;
